paper by H.C. Ohanian, What is spin? , Am. J. Phys. 54, 500-505 (1985). In particular, it is confirmed that “spin” is a classical quan tity which can be calculated for any field using its definition, namely that it i s just the non-local part of the conserved angular momentum. This leads to explicit expressions

To start, Hans C. Ohanian notes that my history of kinematics “is incomplete—it leaves out how nineteenth-century mathematicians developed the description of motion by general curvilinear coordinates, on curved surfaces, and in curved spaces, and the description of geodesic curves, all of which later proved crucial for Einstein’s general relativity.”
