Located in the Tropical Cyclone belt and the Pacific Ring of Fire, it is extremely vulnerable to climate-related

REPUBLIC OF THE PHILIPPINES

Land in the Philippines is overexploited due to two simultaneous trends: population growth and land degradation. Falling from roughly 3% in the 1960s, the population growth rate in the Philippines is still high, as it has remained consistently above 1.5% every year since 2000 (World Bank, n.d.). The quantity of available land per person is thus ...

Climate change is happening now. Evidences being seen support the fact that the change cannot simply be explained by natural variation. The most recent scientific assessments have confirmed that this warming of the climate system since the mid-20th century is most likely to be due to human activities; and thus, is due to the observed increase in greenhouse gas concentrations from human ...
