The physiology of dinosaurs has historically been a controversial subject, particularly their thermoregulation. Recently, many new lines of evidence have been brought to bear on dinosaur physiology generally, including not only metabolic systems and thermoregulation, but on respiratory and cardiovascular systems as well.. During the early years of dinosaur paleontology, it was widely considered ...

Physiology of dinosaurs - Wikipedia

The brainstem (brain stem) is the distal part of the brain that is made up of the midbrain, pons, and medulla oblongata. Each of the three components has its own unique structure and function. Together, they help to regulate breathing, heart rate, blood pressure, and several other important functions. All of these brainstem functions are enabled because of its unique anatomy; since the brainstem ...

Definition. The facial bones (viscerocranium) make up most of the front of the skull. The bones responsible for the form of the face are – from top to bottom – the inferior nasal conchae and the nasal, maxilla, zygomatic, lacrimal, ethmoid, vomer, sphenoid, palatine, and mandible bones. The ethmoid and sphenoid bones are also part of the neurocranium.

Facial Bones - The Definitive Guide | Biology Dictionary

Steps. 1. First, you'll need to grow your plants for the experiment. In each pot, make five holes with your finger about an inch deep. Place one bean in each hole and lightly cover it with soil.
