From Figure 7.3, on page 117, we know the "rotational mass" or

"moment of inertia" for a solid cylinder to be  $I = (1 / 2) m r^2$  and

for a solid sphere to be  $I = (2 / 5) m r^2$ . With its smaller

"rotational mass", the solid sphere is easier to rotate so the solid

sphere will roll down a hill faster.
