Raman spectroscopy (/ˈrɑːmən/); (named after Indian physicist C. V. Raman) is a spectroscopic technique typically used to determine vibrational modes of molecules, although rotational and other low-frequency modes of systems may also be observed. Raman spectroscopy is commonly used in chemistry to provide a structural fingerprint by which molecules can be identified

A metalloid is a type of chemical element which has a preponderance of properties in between, or that are a mixture of, those of metals and nonmetals.There is no standard definition of a metalloid and no complete agreement on which elements are metalloids. Despite the lack of specificity, the term remains in use in the literature of chemistry.. The six commonly recognised metalloids are boron ...

The measurement approach typically consists of applying a sinusoidal current (galvanostatic mode, GEIS) or voltage (potentiostatic mode, PEIS) of a certain amplitude and frequency, and measuring the amplitude and phase shift of the output voltage or current, respectively [].This procedure is repeated for a number of frequencies, typically in the kHz to mHz range, thereby generating a ...

Metal ceramic restorations were considered the gold standard as reliable materials. Increasing demand for esthetics supported the commercialization of new metal free restorations. A growing demand is rising for zirconia prostheses. Peer-reviewed articles published till July 2013 were identified through a Medline (Pubmed and Elsevier).

As a result of collective efforts to move toward clean energy, renewable energy systems have shown tremendous growth, reaching a capacity of 25% of global power output in 2018 ().Photovoltaic (PV) systems have played a key role in this growth by increasing their global power production capacity from 9 GW in 2007 to 509 GW by the end of 2018 ().It is projected that solar power will amount to 10 ...
