the eastern sides of major subtropical high-pressure cells.

How Do Deserts Form? | Britannica

Cold ocean currents contribute to the formation of coastal deserts. Air blowing toward shore, chilled by contact with cold water, produces a layer of fog. This heavy fog drifts onto land. Although humidity is high, the atmospheric changes that normally cause rainfall are not present.

desert | National Geographic Society

Desert—any large, extremely dry area of land with sparse vegetation—is one of Earth's major types of ecosystems. Deserts are found throughout the world, especially in Africa and Australia. The world's largest desert is the Sahara, which covers nearly all of northern Africa. The following list

List of deserts | Britannica

Desert formation. A desert forms when there has been a shortage of rain for a long time. It may have different geological conformations - mainly due to the effect of the wind (wind erosion). There are sand deserts, called erg, rock deserts, called hammada, and pebble deserts, the serir. The history of a desert can be studied through palaeontology.

Desert formation - Eniscuola

Deserts are diverse ecosystems that occur on all seven continents. Learn about the four major types of deserts, the surprising amount of wildlife some of the...

Deserts 101 | National Geographic - YouTube

Some deserts are formed within rain shadow zones, which are the downwind sides of mountains that receive limited rainfall. As moist air passes over a mountain range, it often causes precipitation,...

Earth's Deserts: Definition, Distribution & Location ...

Answers to Formation of Deserts Lab 1. At the equator, where the Earth's surface is mostly water, the sun's rays heat the seas strongly. The warm surface causes water to evaporate and the humid air to rise, producing a low pressure belt. The rising air is

like the rising air over a room heater – it can only go up so far before it cools and lots of rain is produced.

Answers to Formation of Deserts Lab - Answers to Formation ...

The rain shadow effect is a reduction of rainfall and loss of moisture from an area of land on the opposite side of a mountain facing away from prevailing surface winds. How this plays a role in the formation of deserts is mountain ranges force high moisture content air to travel over the mountains.
