Headphones are a pair of small loudspeaker drivers worn on or around the head over a user's ears. They are electroacoustic transducers, which convert an electrical signal to a corresponding sound. Headphones let a single user listen to an audio source privately, in contrast to a loudspeaker, which emits sound into the open air for anyone nearby to hear.. Headphones are also known as earspeakers ...

In the case of a mismatch of 16-ohm loudspeakers with an 8-ohm output impedance, the output power for a tube amplifier decreases only to about 89% and not to 50%, as in the above calculation. And this again applies only to fixed ohmic impedances. A guitar speaker has no fixed impedance over the frequency range. It increases at higher frequencies.

The recommended speaker impedance ratings are usually listed above the speaker wire posts. A home stereo, for example, may often list 6-16 ohms as being ok for use. Also, attempting to wire two 8 ohm speakers in parallel to an 8 ohm stereo would have the same effect.

Coaxial cables and ohms and impedance. Impedance is the amount of resistance the waves proceeding through the coaxial cable encounters. The lower the impedance, the more easily the waves flow through the cable. Each type cable has an impedance rating. Factors affecting this is the size of the cable and what materials the cable is constructed from.

Gauge refers to the thickness of the cable and is given a given a Radio Guide or RG number, with higher numbers indicating thinner conducting cores. Impedance refers to the level of electrical resistance in the wire. Most coaxial cables have an impedance of either 75 or 50 Ohm. The former is primarily used for video signals and the latter for data.
