Oxygen Sensing Responses And Adaption

Atmospheric partial pressure of oxygen (Atm PO₂) Humans depend on oxygen for survival, and this gas is acquired from the atmosphere where the partial pressure of oxygen (Atm PO₂) within the troposphere depends on BP according to the Dalton's Law []:Atm PO₂ = 0.21 · 760 mmHg = 159 mmHg. Humans are constantly exposed to changes in BP, either artificially or naturally, thus, pressure of ...

Hypoxia is a condition in which tissues of the body do not receive sufficient oxygen (O₂) supply. 1,2 The imbalance between tissue O₂ supply and consumption results in an insufficient O₂ supply to maintain cellular function. Hypoxia is defined as an O₂ saturation (SpO₂) < 90%. Hypoxemia is a decrease in oxygen tension in the arterial blood (PaO₂) and is defined as a PaO₂ < 60 mmHg.

SOD is the first line of defense of the antioxidant system in plants and can transform accumulated superoxide molecules into oxygen and H₂O₂, after which CAT, APX, and POD convert H₂O₂ into water and oxygen. In addition, these enzymes work together to scavenge MDA produced from lipid peroxidation to the protect membrane structure.

Temperature shifts are a major challenge to animals; they drive adaptations in organisms and species, and affect all physiological functions in ectothermic organisms. Understanding the origin and mechanisms of these adaptations is critical for determining whether ectothermic organisms will be able to survive when faced with global climate change. Mitochondrial oxidative phosphorylation is ...

Patrick B. Williams, Howard C. Nusbaum, in Neuroimaging Personality, Social Cognition, and Character, 2016 1.8 Emotional Homeostasis and Impulse Control. Emotional homeostasis refers to emotional stability in the face of uncertainty, 48 which is considered in the Ardel Three-Dimensional Wisdom Scale to be a part of the affective dimension of wisdom. 49 As it takes place by an interaction of ...

Insufficient oxygen supply can disrupt homeostasis and compromise survival, and hypoxia-induced cardiovascular failure is fatal in many animals, including humans. However, certain species have adapted and evolved to cope with hypoxic environments and are therefore good models for studying the regulatory mechanisms underlying responses to hypoxia.

A ceramic-electrolyte glucose fuel cell as a power source for implantable biomedical devices is introduced and demonstrated. The highly miniaturized device with a thickness below 400 nm exhibits a peak power density of 43 μW cm⁻², is fully integrated into silicon, and consists of only ceramic and noble-metal materials for easy sterilization.

Soils are the source of most of the antibiotics used to fight human diseases, control the movement of water and chemical substances between the Earth and atmosphere, and act as source and storage media for gases such as oxygen, carbon dioxide, and methane. As a result of their essential importance, soils are also part of our cultural heritage.

Background High temperature, whether transitory or constant, causes physiological, biochemical and molecular changes that adversely affect tree growth and productivity by reducing photosynthesis. To elucidate the photosynthetic adaption response and examine the recovery capacity of trees under heat stress, we measured gas exchange, chlorophyll fluorescence, electron transport, water use ...

The importance of the gut-brain axis in maintaining homeostasis has long been appreciated. However, the past 15 yr have seen the emergence of the microbiota (the trillions of microorganisms within and on our bodies) as one of the key regulators of gut-brain function and has led to the appreciation of the importance of a distinct microbiota-gut-brain axis.
