In thermodynamics, an isentropic process is an idealized thermodynamic process that is both adiabatic and reversible. The work transfers of the system are frictionless, and there is no net transfer of heat or matter. Such an idealized process is

m^{-3}) leaving a 3-cm-diameter pipe strikes a plate that can rotate about a pivot. The force exerted on the plate by the air jet is counteracted by a spring. When the velocity of the air jet leaving the pipe is 50 m s^{-1} , the plate is perfectly vertical and the spring is displaced from its equilibrium position by 2 cm.

A belt connects a pulley of 2-inch radius with a pulley of 5-inch radius as shown on the picture below. If the larger pulley turns through 10 radians per second, determine each of the following:

a) The linear speed of a point on the circumference of the larger wheel.

Specific Heat Capacity Definition . Specific heat capacity is the amount of heat energy required to raise the temperature of a substance per unit of mass. The specific heat capacity of a material is a physical property. It is also an example of an extensive property since its value is proportional to the size

termodinámicas fundamentales es la descripción del trabajo termodinámico en analogía con el trabajo mecánico, o el peso elevado a través de una elevación contra la gravedad, como lo definió el físico francés Sadi Carnot en 1824. Carnot usó la frase fuerza motriz para el trabajo.
