In physics, a plasmon is a quantum of plasma oscillation. Just as light (an optical oscillation) consists of photons, the plasma oscillation consists of plasmons. The plasmon can be considered as a quasiparticle since it arises from the quantization of plasma oscillations, just like phonons are quantizations of mechanical vibrations. Thus, plasmons are collective (a discrete number) oscillations ...

2. Natural Fibre. Natural fibre can be obtained from plants, animals or the environment. Figure 1 and Figure 2 show basic information about the branches of biocomposites and natural fibres classification. The advantages of natural fibres over synthetic fibres are their recyclability and biodegradability [11,12,13]. The natural fibre market and production are drastically progressing, shifting ...

Sol-gel is a method for producing solid materials from small molecules. In this chemical procedure, the sol (or solution) gradually evolves toward the formation of a gel-like diphasic system containing both a liquid phase and a solid phase, the morphologies of which range from discrete particles to continuous polymer networks (). Ultrafine and uniform ceramic powders can be formed by precipitation.

At such low scale the magnetic properties of NPs dominated effectively, which make these particle priceless and can be used in different applications (Faivre and Bennet, 2016, Priyadarshana et al., 2015, Reiss and Hütten, 2005, Zhu et al., 1994). The uneven electronic distribution in NPs leads to magnetic property.

1. BACKGROUND. Non-specific lipid-transfer proteins (nsLTPs) are a ubiquitous multigene family of molecules expressed in the Plant kingdom, starting life 470 million years ago in Marchantiophyta, the first plants grown on land after red and green algae. 1 Despite their longevity, nsLTPs were first discovered in plants only about 40 years ago, by Jean-Claude Kader, whose numerous and ...
